Section 1

Introduction

The Case for Lightweight Markup

What is Wrong with \TeX ?

1. High Markup to Text Ratio

- Knuth (1986) is 22 % markup.
- Downey et al. (2016) is 21 % markup.

2. Zero Sandboxing Support

- The document you are typesetting may not compile.
... a file named `\texttt{evil_underscores.tex}` ...
- The document you are typesetting may halt.
`\def\whiletrue{\whiletrue} \whiletrue`
- The document you are typesetting may access the system shell.
`\immediate\write18{sudo rm -rf /}`

3. Steep Learning Curve

The Case for Lightweight Markup

Comparison of \LaTeX and Markdown

```
\section{This is a level one heading}
```

This is a text paragraph with `\emph{emphasis}`.

```
\begin{quotation}This paragraph will show as a quote.\end{quotation}
```

```
\begin{verbatim}
```

This is is a source code example.

```
\end{verbatim}
```

```
\begin{itemize}
```

```
  \item First item with \alert{strong emphasis}
```

```
  \item Second item with a link%
```

```
    \footnote{See \url{http://link.com} (Title)}
```

```
\end{itemize}
```

```
\begin{enumerate}
```

```
  \item First item with \verb`inline code`.
```

```
  \item Second item with an \includegraphics{image.png}
```

```
\end{enumerate}
```

The Case for Lightweight Markup

Comparison of \LaTeX and Markdown

This is a level one heading

This is a text paragraph with *_emphasis_*.

> This paragraph will show as a quote.

```
~~~~~This is is a source code example.
```

* First item with ****strong emphasis****

* Second item with a [link](http://link.com/ "Title")

1. First item with ``inline code``.

2. Second item with an ![image](image.png "Title")

The Case for Lightweight Markup

How is Markdown Useful?

1. Minimal Markup to Text Ratio

- Recall: Knuth (1986) and Downey et al. (2016) are ~22 % markup.
- Gillespie et al. (2016) is 5.5 % markup.
- Grolemond et al. (2016) is 3.8 % markup.

2. Sandboxing Support

- A Markdown document converted to $\text{T}_{\text{E}}\text{X}$ will always compile.
- The document may neither halt nor access the shell.

3. Hybrid Markup Support

- Markdown was designed to supplement HTML, not replace it.
- Structurally simple sections can use pure Markdown, complex sections may combine Markdown and the host markup.

4. Mild Learning Curve

Existing Solutions

The Swiss Army Knife of Pandoc

*If you need to **convert files from one markup format into another**, Pandoc is your swiss-army knife.*

— MacFarlane ([2016b](#)), emphasis mine

- A multi-target publishing software.
- Supports tens of markup languages (Markdown, \LaTeX , HTML, XML Docbook) and output formats (ODF, OOXML, PDF).
- The use of Pandoc for the preparation of \LaTeX documents has been described by Dominici ([2014](#)).

What is Wrong with Pandoc?

Heading {#link}

This is `\protect\hyperlink{link}{a link}`.

- Markdown documents cannot be directly edited at collaborative \LaTeX platforms such as Share \LaTeX or Overleaf.

Existing Solutions

What is Wrong with Pandoc?

3. Half-hybrid, Half-sandboxed

- The input is heuristically parsed and sanitized:

This `{will}` 2^n `\begin{get}` s~nitized and `\this{will}` not `\begin{equation}` 2^n `\end{equation}` $\$2^n\$$.

This `\{will\}` 2^n `\textbackslash{begin\{get\}`
`s\textasciitilde}` nitized and `\this\{will\}` not
`\begin{equation}` 2^n `\end{equation}` `\(2^n\)`.

- Malicious input such as

```
\def\shell{18} \immediate\write\shell{sudo rm -rf /}
```

is left alone by Pandoc.

Section 2

The Markdown Package

Building a Parser

Is T_EX Up to the Task?

There exist formal language parsers written solely in T_EX. These parsers recognize regular (L^AT_EX3 Project, 2016) and context-free LL(1) languages (Carlisle, 2000). Markdown is not context-free:

```
`There is a literal backtick (`) here.`
```

and a parser needs to be able to backtrack over the entire input:

```
[this is not a link](http://link.com/ "Title"
```

Implementing a recursive-descent parser with backtracking in T_EX is possible, but generally a bad idea:

- Difficult to Maintain, Highly Unidiomatic
- Lack of Efficient Data Structures

Building a Parser

Can We Use Lua Instead of \TeX ?

Lua is a powerful, efficient, lightweight, embeddable scripting language. It supports procedural programming, object-oriented programming, functional programming, data-driven programming, and data description.

— Lua Team (2016)

Lua \TeX is an extended version of pdf \TeX using Lua as an embedded scripting language.

— Lua \TeX Team (2016)

Building a Parser

Can We Use Lua Instead of $\text{T}_{\text{E}}\text{X}$?

- With Lua $\text{T}_{\text{E}}\text{X}$, we can directly execute Lua code:

```
1 + 2 = \directlua{ tex.sprint(1 + 2) }
```

- With pdf $\text{T}_{\text{E}}\text{X}$ and other modern $\text{T}_{\text{E}}\text{X}$ engines, we can spawn a shell and execute the Lua code in a separate process:

```
1 + 2 = \newwrite\script
\immediate\openout\script=script.lua
\immediate\write\script{ print(1 + 2) }%
\immediate\closeout\script
\immediate\write18{texlua script.lua > output.tex}%
\input output.tex
```

Building a Parser

The Lunamark Library

- Lunamark (MacFarlane, 2016a) is a Markdown parser for Lua.
- The language is specified using a Parsing Expression Grammar (PEG) via the LPeg C library (with some cheating).
 - PEGs are CFGs with ordered choice; as a corollary, any PEG is unambiguous. (Ford, 2004) An input word u can be parsed according to a PEG G in linear time relative to the size of u . (Ford, 2002) It is conjectured that not all CFLs are recognized by a PEG.
 - The dependencies of Lunamark were all either compiled into LuaTeX (LPeg, Slnunicode), or unneeded (Cosmo, Alt-getopt).
- The library has been released under the Expat (MIT) License.

The Lunamark Library

- produces a parse tree rather than presentation markup:

This is [a link](#link).

```
\markdownRendererHeadingOne{Heading}
```

The Markdown T_FX package:

- 15/33

Using Markdown from Within \LaTeX

The Sandbox and Hybrid Modes

```
\documentclass{article}
\usepackage{markdown}
\begin{document}
\begin{markdown}
  Foo bar \TeX{}  $2^n$ .
\end{markdown}
\begin{markdown*}{hybrid}
  Foo bar \TeX{}  $2^n$ .
\end{markdown*}
\end{document}
```

Foo bar \TeX 2^n . Foo bar \TeX 2^n .

Using Markdown from Within \LaTeX

Mapping Markdown Tokens to \TeX Macros

```
\documentclass{article}
\usepackage{markdown}
\markdownSetup{renderers = {
  link = {#1\footnote{See \url{#3} (#4)}}},
}}
\begin{document}
\begin{markdown}
  Foo [bar](http://link.com "Link").
\end{markdown}
\end{document}
```

Foo bar¹.

¹See <http://link.com> (Link)

Using Markdown from Within \LaTeX

Syntax Extensions

- Some syntax extensions were already supported by Lunamark:
 - footnotes,
 - definition lists,
- New syntax extensions were added as a part of the project:
 - citations,
 - fenced code blocks.

Using Markdown from Within \LaTeX

Syntax Extensions – `\markdownSetup{footnotes}`

Here is a footnote reference, ^[^1] and another. ^[^long]

^[^1]: Here is the footnote.

^[^long]: Here's one with multiple blocks.

Subsequent paragraphs are indented to show that they belong to the footnote.

Here is a footnote reference, ² and another. ³

²Here is the footnote.

³Here's one with multiple paragraphs.

Subsequent paragraphs are indented to show that they belong to the footnote.

Using Markdown from Within \LaTeX

Syntax Extensions – `\markdownSetup{definitionLists}`

Using Markdown from Within \LaTeX

Syntax Extensions – `\markdownSetup{citations}`

Here is a parenthetical citation [`@knuth86`] and a string of several [`see @knuth86`, pp. 33-35; also `@gruber04`, chap. 1].

Here is a text citation `@knuth86` and a string of several `@knuth86` [pp. 33-35; `@gruber04`, chap. 1].

Here is a parenthetical citation (Knuth, 1986) and a string of several (see Knuth, 1986, pp. 33-35; also Gruber, 2004, chap. 1).

Here is a text citation Knuth (1986) and a string of several Knuth (1986, pp. 33-35) and Gruber (2004, chap. 1).

Using Markdown from Within \LaTeX

Syntax Extensions – `\markdownSetup{fencedCode}`

```
~~~ js
if (a > b)
  return c + 4;
else
  return d + 5;
~~~~~
```

```
if (a > b)
  return c + 4;
else
  return d + 5;
```

Section 3

Conclusion

Conclusion

The Missing Pieces of the Puzzle

- Apart from the \LaTeX interface, the package also exposes Lua, plain \TeX and $\text{Con}\text{\TeX}$ t interfaces.
- The package includes 82 pages of user and technical documentation. (Novotný, [2016a](#))
- A section on writing \LaTeX documents in Markdown was added to the `fithesis3` sample documents.
- The package was released under the \LaTeX Project Public License (LPPL) 1.3 on the Comprehensive \TeX Archive Network (CTAN), GitHub, and the faculty GitLab. (Novotný, [2016c](#)) It is available in updated \TeX Live 2016.

Conclusion

Reception by the Community

- The syntax extensions were backported to Lunamark and merged by MacFarlane, resulting in a new minor version release of the library (0.5.0). (Novotný, [2016b](#))
- The package was featured on the twitter profile of Overleaf – a major online service for preparing \LaTeX documents – along with original example documents. (Overleaf, [2016](#))
- The package was reviewed in the bulletin of the German \TeX Users Group (DANTE e.V.). (Fenn, [2016](#), pp. 43)
- An article about the package has been accepted for publication in the bulletin of the Czechoslovak \TeX Users Group (CSTUG).
